CloneCut 1.0.5

Smart Multi-Size Video Export & Naming Tool

Intorduction

2.Industry Context：Game UA video production

Game user acquisition (UA) videos are short advertising videos used to promote mobile and online games across multiple digital platforms. These videos are distributed through social media and advertising networks to attract new players.

Different platforms require **different aspect ratios and formats**. As a result, production teams must export the same video into multiple sizes for distribution on various channels.

Common platforms include:

- TikTok
- Instagram
- YouTube Shorts
- Facebook Ads
- Mobile ad networks

Because of these requirements, a single video often needs to be exported in several aspect ratios, such as:

- 9:16 (vertical video)
- 1:1 (square video)
- 16:9 (horizontal video)
- 4:5
- 2:3

This creates repetitive editing, exporting, and file-naming tasks in the production workflow.

3.The **Workflow** Problem CloneCut Solves

A workflow survey conducted among professionals in the game user acquisition video production industry:

Participant 1： **20 min**. Edited different aspect ratios in **CapCut**, then used **Bulk Rename Utility** to batch rename the exported files.

Participant 2： **20 min**. Edited multiple aspect ratios in **CapCut**, then batch renamed the files using **Bulk Rename Utility**.

Participant 3： **20 min**. Manually edited each aspect ratio one by one, copied the filenames into **CapCut drafts projects**, and exported each video individually.

Participant 4： **20 min**. Edited the vertical version in **Premiere Pro**, exported different frame sizes using scale-to-fill and preset settings, then renamed the files one by one in the folder.

Participant 5： **30 min**. Used **Premiere Pro**. An internal tool could change the aspect ratio with one click, but only one size could be processed and exported at a time.

With CloneCut

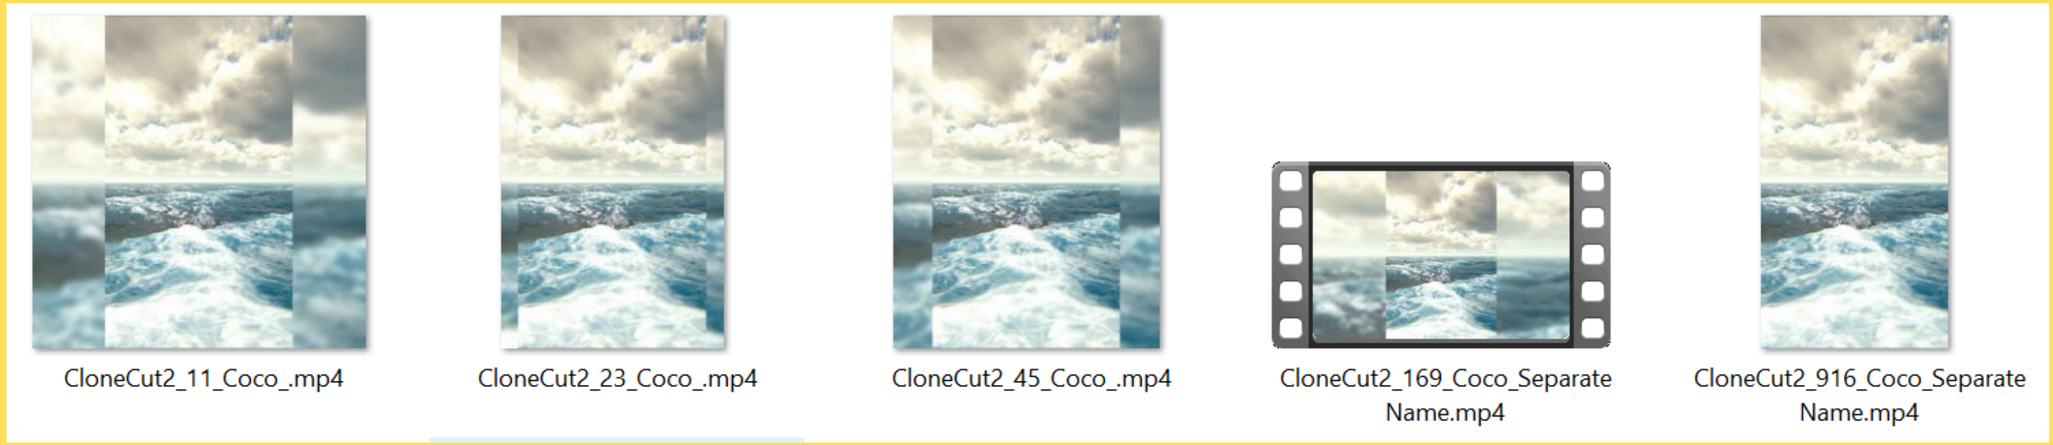
1 minute to set up filenames and sizes.

Automatically exports all videos as a ZIP files in **1~3 minutes** (depending on video length).

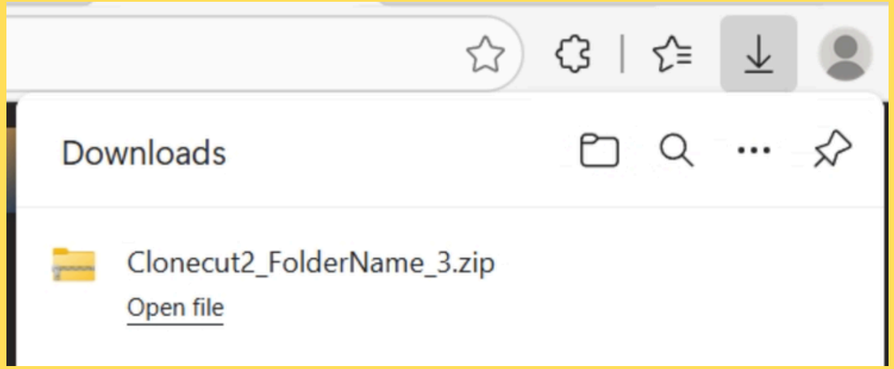
How CloneCut Helps

Upload a 9:16 video and <u>automatically export multiple versions with fully customizable folder and video filenames.</u>

9:16 video



1. Upload 9:16 video
2. choose the size you need
3. costum each video files name AT SAME TIME
4. enter the zip file/folder name
5. click to download



Process Overview

1. Upload video

16:9

2. Select Output Aspect Ratios

16:9 | 9:16 | 1:1 | 4:5 | 2:3

3. File Name Builder

4 types of building blocks (add the block to the Filename Queue)

- SameName Block
- Size Name Block (Default)
- Variant Block
- Preset SameName Block

CloneCut2 _ 16:9=169, 9:16=916, 1:1=11,... _ example: 16:9=666, 9:16= 333, 1:1= cube, 4:5=table, 2:3= _ QuickBlock

Filename Queue

-Naming all the names of videos at same time

4. Custom: 3 types of preset blocks

template:

Filenmae Queue template

Preset SameName:

_ all: QuickBlock

Preset Variant Block:

Edited Variant Block

5. Export ZIP Folder name

example: CloneCut2_Test

Start Download

Get your videos folder

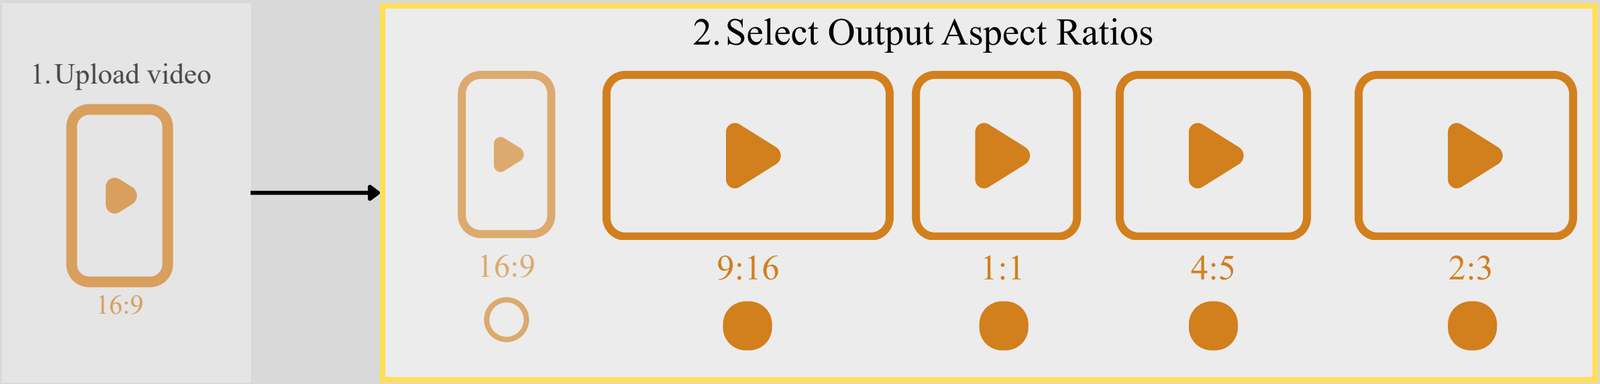
ZIP CloneCut2_Test

CloneCut2_Test

Output Video name example:

- 916 Name: CloneCut2_916_333_QuickBlock
- 11 Name: CloneCut2_11_Cube_QuickBlock
- 45 Name: CloneCut2_45_table_QuickBlock
- 23 Name: CloneCut2_23__QuickBlock

Model 2- Select Output Aspect Ratios



size detail：

16:9= 1920*1080

1:1= 1080*1080

2:3= 720*1080

4:5= 1080*1350

9:16=1080* 1920

Frame rate: **60 fps** for all exported videos.

Background processing

When adapting the video to different aspect ratios:

- The source video is scaled to fill the frame
- A blurred background layer is generated
- **Background blur radius: 10px**
- The original video is centered as the foreground layer

Encoding

Video codec: H.264

Audio codec: AAC

Container: MP4

Model3 - File Name Builder

4 types of building blocks (add the block to the Filename Queue)

SameName Block

Size Name Block（Default）

Variant Block

Preset SameName Block

Each block includes:
1. Edit button
2. Move left
3. Move right
4. Delete Block

Filename Queue

-Naming all the names of videos at same time

Enter: CloneCut2

_

Size Name Block（Default）

_

Enter Variant Block Name：Example1

_

QuickBlock

16:9=CloneCut2

4:5=QuickBlock
2:3=QuickBlock

Enter Template name and **SAVE AS A BLOCK?**

save as Preset Variant Block ?

Model4 Custom: 3 types of preset blocks

Example1

Preset Variant Block：

_

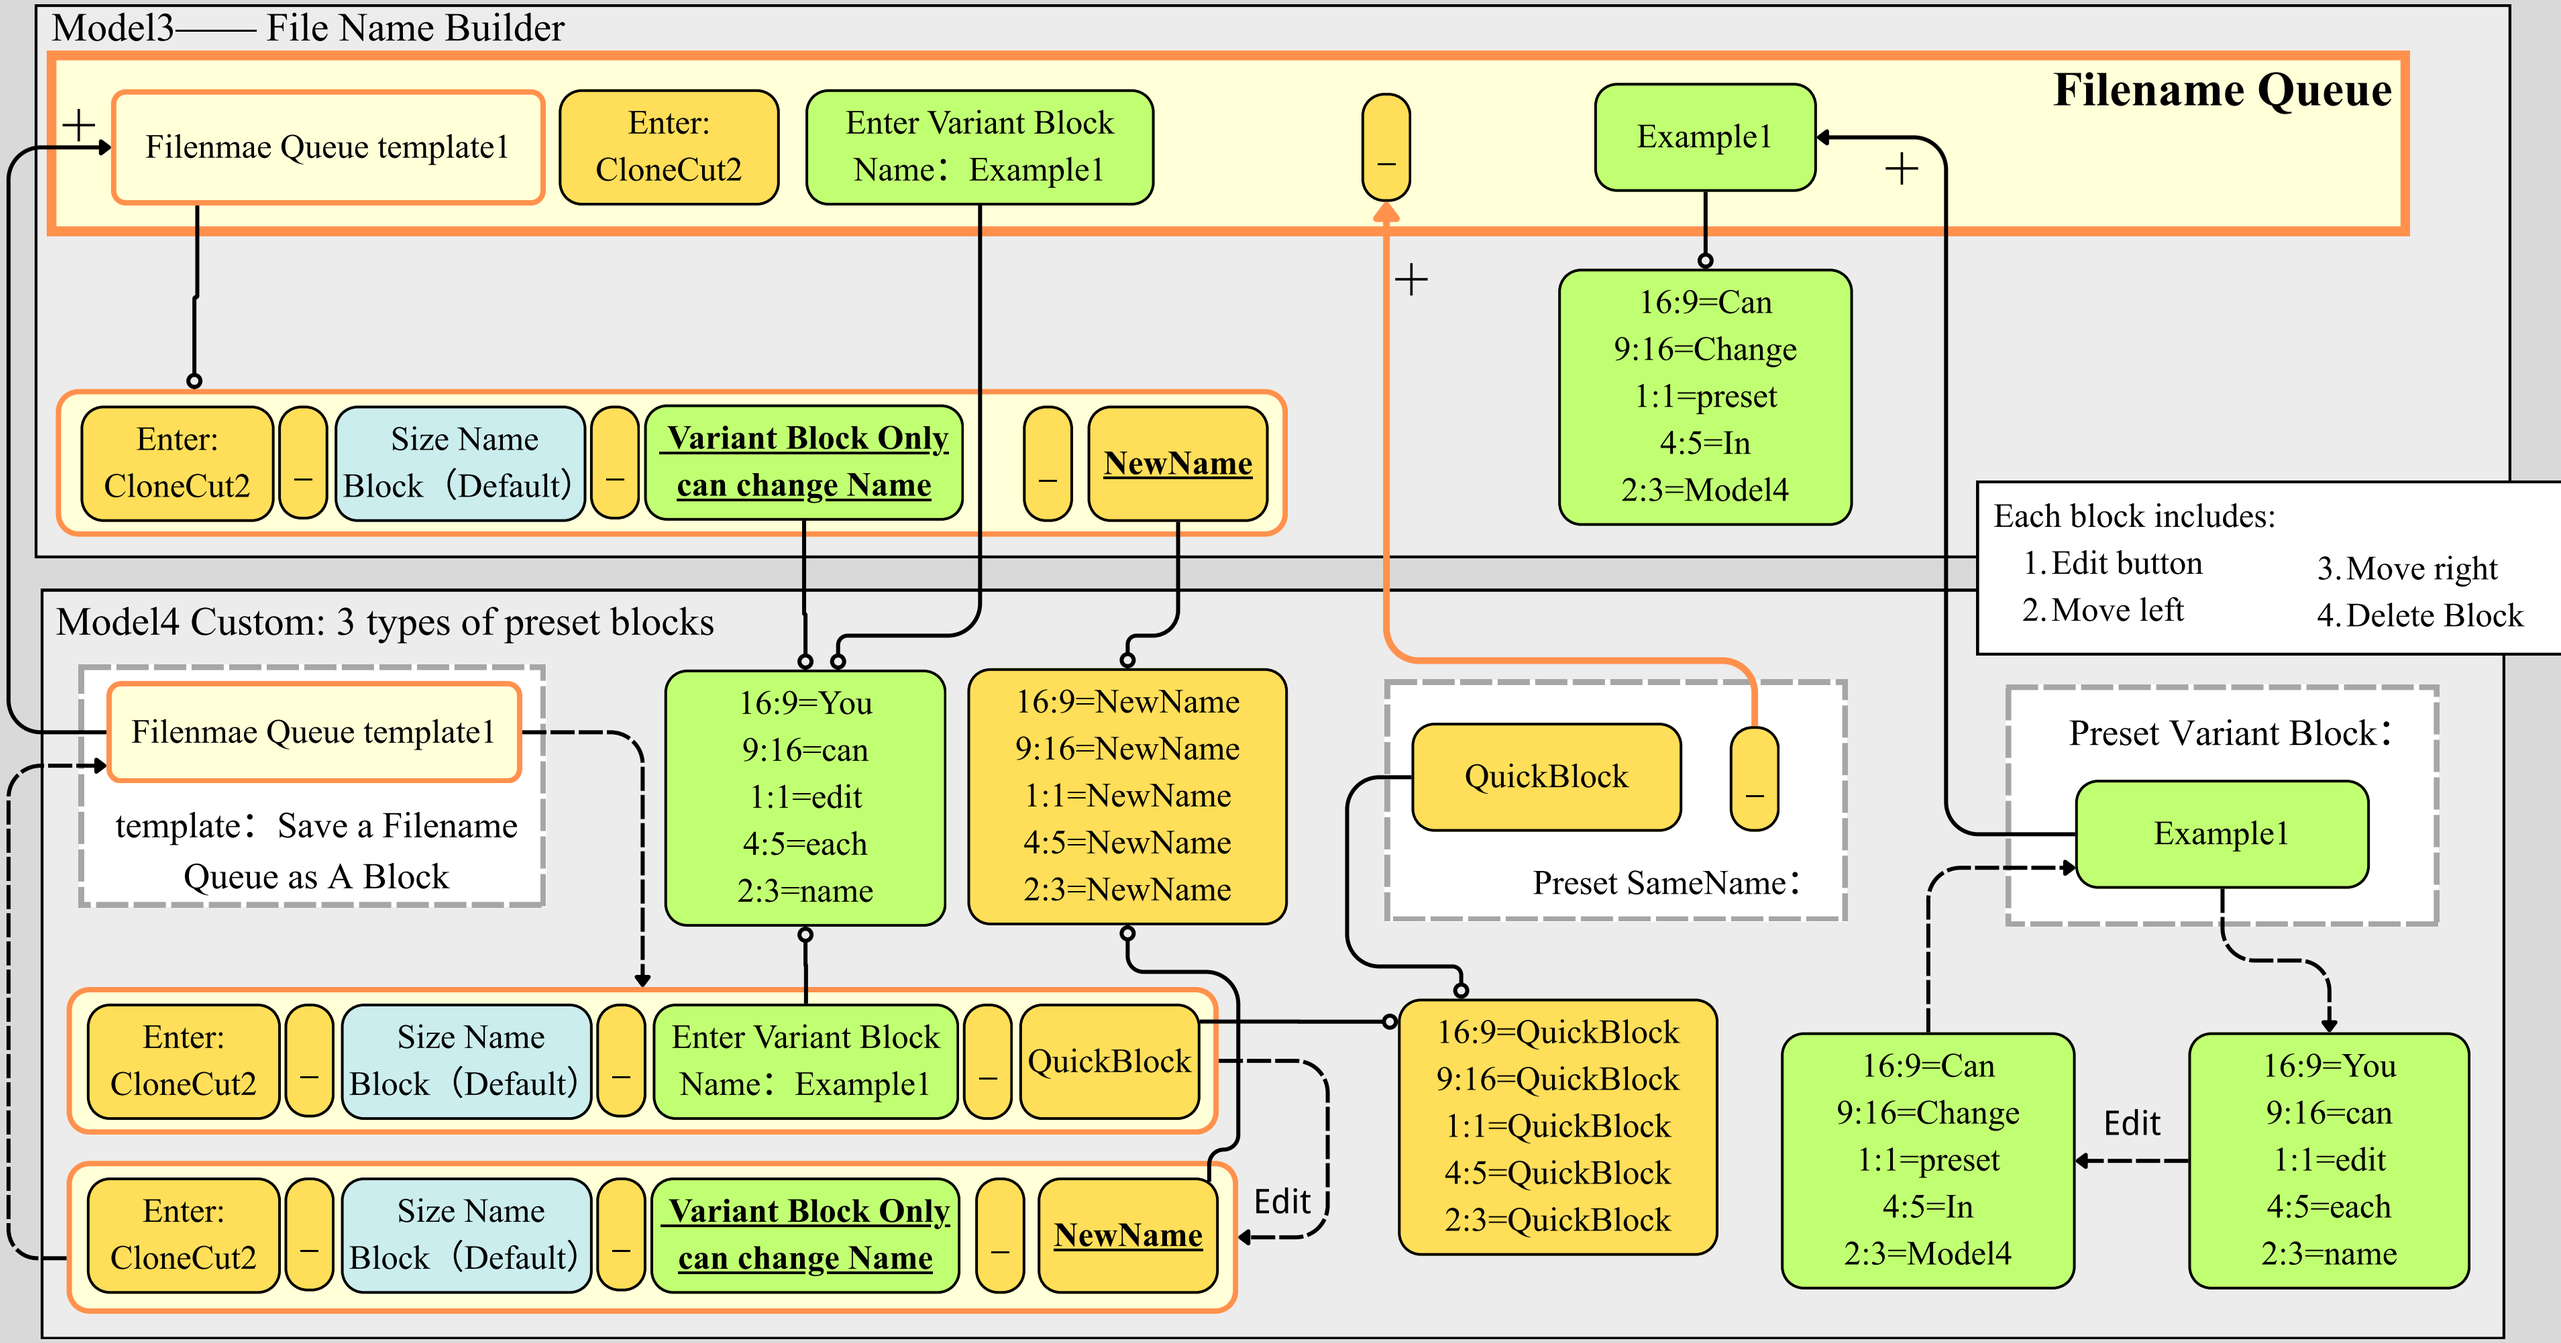
QuickBlock

Preset SameName：

Filenmae Queue template1

template：

Model4 - Custom

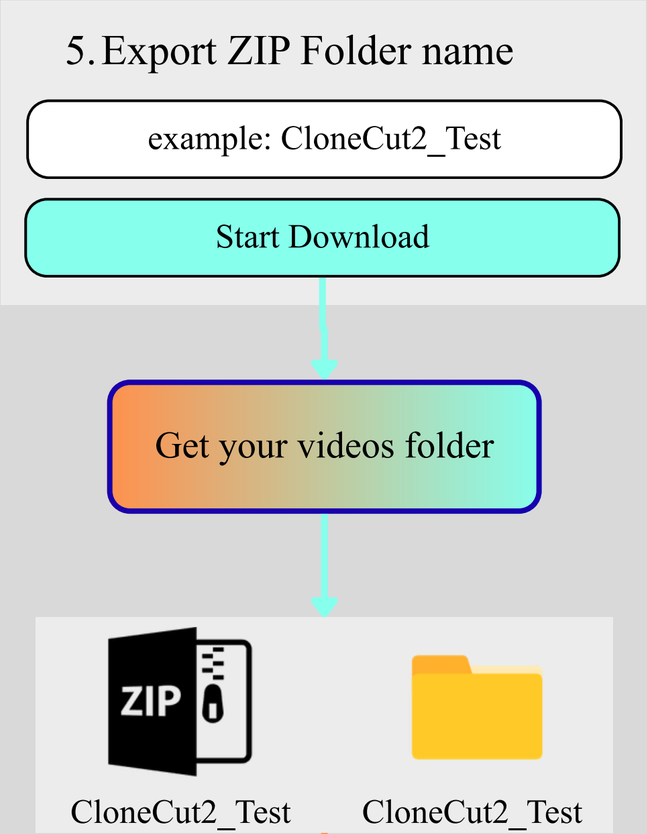


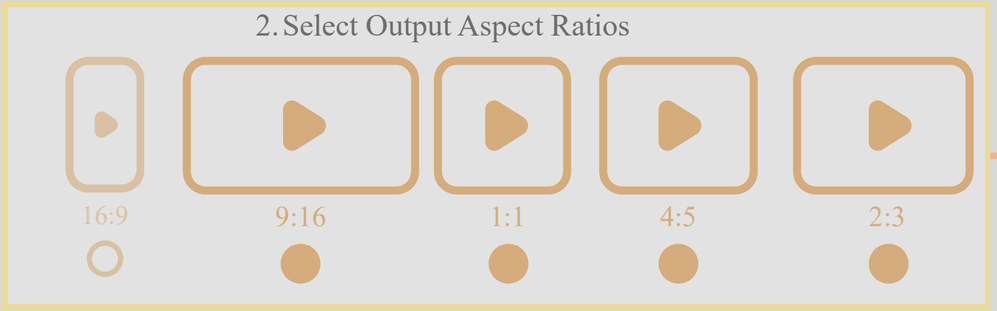
Model5 - Export ZIP Folder name

A **15 second** video typically takes about **1 minutes** to process and download all size.
A **30–60 second** video typically takes about **1–3 minutes** to process and download all size.

After clicking the download button, there will be no indication of the process being generated until the download is successful.

（Actual processing time may vary slightly depending on computer performance. The developer's testing environment uses an RTX 4080 GPU.）





Filename Queue

Output Video name example:

- 916 Name: CloneCut2_916_333_QuickBlock
- 11 Name: CloneCut2_11_Cube_QuickBlock
- 45 Name: CloneCut2_45_table_QuickBlock
- 23 Name: CloneCut2_23__QuickBlock

CloneCut1.0.0 VS CloneCut 1.0.5

1. Fixed the issue where the delete key for all blocks except the default size in Module 3 was ineffective.
2. Fixed the issue where various detection prompts caused a blank page to be displayed independently, resulting in the block sequence being lost when returning to the webpage.
3. Fixed an issue where incomplete distinguishing names would automatically add size numbers. Now, if no distinguishing name is entered, it will be skipped as blank.
4. Fixed an issue where distinguishing names could not be saved to Module 4 as presets.
5. Fixed an issue where selecting a distinguishing name in Module 3's queue prevented viewing its details. It can now be viewed freely.
6. Fixed an issue where even if every distinguishing name block in Module 3 was displayed correctly, regardless of the entered information, the download would still consider it incomplete, replacing all distinguishing names with size numbers.
7. Usable. Distinguishing names are now correctly added from Module 4 to Module 3's naming queue and can be temporarily modified. Module 4 presets are unaffected.
8. Fixed an issue where temporary modifications to templates in Module 3 would synchronously affect template blocks added from the same source, regardless of whether they were added before or after the modification.
9. Fixed an issue where newly added template blocks are unaffected by temporary modifications already in Module 3, maintaining their original preset (equivalent to the issue caused by adding later in the first point).
10. Temporary distinguishing names set in Module 3 will now be stored correctly in the template after clicking "Save Template".

CloneCut1.0.0 VS CloneCut 1.0.5

1. 修正了模块3中除默认大小外所有块的delete键无效的问题。
2. 修复了各种检测提示导致独立显示空白页，导致返回网页时块序列丢失的问题。
3. 修复了区别名填写不全会默认添加尺寸数字的问题。修改为如果没有填写将当作空白跳过。
4. 修复了区别名不可以保存到模块4作为预设的问题。
5. 修复了区别名在模块3的队列中选中无法查看该积木具体内容的问题。现可以自由查看
6. 修复了区别名即使在模块3每一个区别名积木都正确显示，但是无论填写是怎样的，下载时都判定为未填写完整，全部区别名都用尺寸数字代替的问题。
7. 可用。区别名正常从模块四添加去模块3的命名队列，并且可进行临时修改。且模块4的预设不受影响。
8. 修复了模板在模块3中的临时修改会同步影响同源添加的模板积木内容，无论在修改前添加的或后添加的。
9. 修复了新添加的模板积木不受已经在模块3中的临时修改模板积木影响，保持原版预设，（相当于第一条的后添加导致情况）。
10. 在模块3中设置的临时区分名将在点击“保存模板”后正确存储在模板中。
